Syringe printing machine

The machine uses the rotary pad principle to print onto syringes over 360° with a high print quality and high print position accuracy. The syringes are automatically supplied to the revolver head for fixation onto the mandrels.

The syringes are pretreated, printed, dried and then unloaded by an automatic ejection system. The capacity depends on the exact syringe dimensions:

- 1 ml : 15 000/hour
- 5 ml : 12 000/hour
- 10 ml : 8 000/hour
- 20 ml : 7 500/hour

Also a vision system to control the print quality can be installed as an option on the machine.
